APPENDIX A	Desk Study Information
------------	------------------------

1.0 INTRODUCTION

1.1 General

Geo-Environmental Services Limited (Geo-Environmental) was instructed by Bargate Homes to undertake a Phase I desk study into the geotechnical and geo-environmental factors pertaining to the planned redevelopment of the land at Beechlands Road, Medstead, Alton, GU34 5EQ herein referred to as 'the site'. The site's location is presented in Figure 1.

1.2 Form of Development

It is understood that the site is proposed to be developed with houses, private gardens, access roads and associated infrastructure.

1.3 Objectives

The investigation was to comprise a desk study of geotechnical and geo-environmental factors pertaining to the site, including a review of available historic maps and an examination of other available sources of geo-environmental information.

A preliminary Risk Assessment (PRA) was to be undertaken as part of the desk study in accordance with CLR11. The objective of the risk assessment was to evaluate plausible pollutant linkages with respect to the proposed development, adjacent land uses, and the wider environment, in the context of planning, immediate liabilities under the Environment Act 1990, and risks posed to Controlled Waters under the Water Resources Act.

1.4 Standards

Where practicable, the desk study was undertaken in accordance with the following documents and guidance:

- National Planning Policy Framework – March 2012;
- Planning Policy Statement 23 – Planning and Pollution Control;
- Model Procedures for the Management of Contaminated Land, CLR11, DEFRA and Environment Agency 2004;
- Environment Agency Guidance on Requirements for Land Contamination Reports, Version 1 dated July 2005;
- BS10175:2011 - Investigation of Potentially Contaminated Sites - Code of Practice, BSI 2011;
- BS5930: 2015 - Code of Practice for Site Investigations, BSI 2015;
- EN ISO 14688 Geotechnical Investigation and Testing Part 1-2002 and Part 2-2004;
- BS1377: 1990 - Soils for Civil Engineering Purposes, BSI1990;
- NHBC Standards Chapter 4.1 Land Quality - Managing Ground Conditions;
- NHBC Standards Chapter 4.2 Building Near Trees;
- CIRIA C665 – Assessing risks posed by hazardous ground gases to buildings (2007);
- NHBC 10627-R01(04)- Guidance on evaluation of development proposals on sites where methane and carbon dioxide are present (2007);
- BS8485:2015 Code of practice for the design of protective measures for methane and carbon dioxide ground gases for new buildings;
- Department of Environment - Industry Profiles (1995 - 1996).

1.5 Conditions

The information collected from the desk study has been used to provide an interpretation of the geotechnical and environmental conditions pertaining to the site. The recommendations and opinions expressed in this report are based on the data obtained. Geo-Environmental takes no responsibility for conditions that have either not been revealed in the available records or that occur between or under points of any physical investigation. Whilst every effort has been made to interpret the conditions, such information is only indicative and liability cannot be accepted for its accuracy.

Information contained in this report is intended for the use of the Client, and Geo-Environmental can take no responsibility for the use of this information by any party for uses other than that described in this report. Geo-Environmental makes no warranty or representation whatsoever expressed or implied with respect to the use of this information by any third party. Geo-Environmental does not indemnify the Client or any third parties against any dispute or claim arising from any finding or other result of this investigation report or any consequential losses.

2.0 DESK STUDY

The findings of the Phase I desk study are presented in the following section. A copy of the information obtained as part of the desk study is presented in Appendix A.

2.1 Site Features

Table 2.1 below summarises the pertinent site features.

Site Information	The site comprises two attached rectangular fields accessible via a gate off Beechlands Road.
National Grid Reference	466750, 135750
Site area	3.28
Shape of site	Irregular
Topography	Flat and level
Signs of landslides	None
Signs of subsidence	None
Current site use	Agricultural, pasture
Structures on site	None on site. Two residential properties adjacent to the east and west.
Any tanks	Septic tank on adjacent property
Evidence of surface staining	None
Retaining walls	None
Weep holes	None
Trees	Many mature deciduous trees on site
Surface of site	Surface was grass pasture
Evidence of services	Telephone wire along southern boundary
Evidence of filled ground or stockpiled materials	None
Any fly tipped materials	None
Evidence of ACMs	None
Vegetation die back	None
Evidence of a high water table	None
Boundaries	Roads, mature trees and hedgerows
Neighbouring area	Residential properties to the north and east; Agricultural land use to the south and west
Contaminative surrounding uses	Potentially infilled ground to the south (former chalk pit)

Table 2.1 Pertinent Site Features

2.2 Geology

British Geological Survey geological mapping indicated the geology of the site to comprise Head Deposits in the north of the site and Clay With Flints in the remainder of the site with the Seaford Chalk Formation (part of the White Chalk Subgroup) underlying these superficial deposits across the whole site. In addition, given the previous agricultural land use and nearby farms and residential development there remains the possibility that there may be areas of reworked, disturbed or Made Ground across the site.

BS5930:2015 defines **Made Ground** as anthropogenic ground in which the material has been placed without engineering control and/or manufactured by man in some way, such as through crushing or washing, or arising from an industrial process. Great variations in material type, thickness and degree of compaction invariably occur and there can be deleterious or harmful matter, as well as potentially methanogenic organic material. In addition, where identified it is not uncommon for asbestos to be present within Made Ground soils.

Head Deposits are drifts produced by solifluxion, the downslope movement of debris outwash during the periglacial period, and characteristically comprise poorly sorted sands gravels and chalk of local derivation.

Clay With Flints comprise for the most part brown sandy clays with a varying proportion of flints. The deposits are generally confined to the Chalk areas where they cap the high ground. The material is derived from the weathering of the flints out of the chalk, and the addition of clay from Eocene outliers.

The **White Chalk Subgroup** is a soft white friable microporous limestone composed of coccolith biomicrites with a varying proportion of larger shell fragments. Flint characterises the White Chalk Subgroup, occurring as nodular courses, tabular beds and linings to fractures.

At various levels clay sized material occurs as marl seams and partings. Close to the surface the upper few metres are invariably discoloured brown, due to leaching from the overlying strata. The interface with any overlying stratum is invariably extremely irregular as a result of localised weathering and general solution. Weathering by frost action may extend to a depth of several metres.

Occasional erosional features, such as pipes, swallow holes and solution cavities, usually infilled with drift deposits, are found in the chalk, sometimes manifesting themselves at the surface as shallow circular depressions. Solution features may be reactivated by the concentrated ingress of water from leaking drains or soakaways. Reactivation may lead to surface collapse.

2.3 Hydrogeology

With reference to information provided by the Environment Agency, the superficial geology of the site was indicated to be classified as a Secondary Undifferentiated Aquifer (Head) and Unproductive Strata (Clay With Flints). The underlying Seaford Chalk Formation was indicated to be classified as a Principal Aquifer.

Secondary Undifferentiated aquifer is the assigned in cases where it has not been possible to attribute either category A or B to a rock type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.

Unproductive Strata are rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow.

Principal aquifers are layers of rock or drift deposits that have high intergranular and/or fracture permeability - meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale. In most cases, principal aquifers are aquifers previously designated as major aquifer.

In addition, the site was indicated to be outside of any source protection zone with regard to the protection of groundwater for potable supply.

The site was indicated to be outside a source protection zone.

Fifteen discharge consents to groundwater were recorded within a 500m of the subject site as shown in Table 2.2 below.

Discharge type	Date	Receiving waters	Direction	Distance (m)
Sewage Discharges - Final/Treated Effluent - Not Water Company	1st September 2009	Groundwater Via Soakaway	N	82
Sewage Discharges - Final/Treated Effluent - Not Water Company	8th September 2015	Groundwater-Land	NE	253
Sewage Discharges - Final/Treated Effluent - Not Water Company	10th April 2012	Groundwater Via Infiltration System and Via Borehole	NE	282
Sewage Discharges - Final/Treated Effluent - Not Water Company	8th June 2010	Ground Waters Via Soakaway	E	296
Sewage Discharges - Final/Treated Effluent - Not Water Company	28th January 2010	Groundwater	E	297
Sewage Discharges - Final/Treated Effluent - Not Water Company	18th November 2011	Groundwater Via Borehole	E	299
Sewage Discharges - Final/Treated Effluent - Not Water Company	2nd February 2010	Ground Waters Via Soakaway	E	305
Sewage Discharges - Final/Treated Effluent - Not Water Company	22nd May 2008	Groundwater Via Soakaway	E	324
Sewage Discharges - Final/Treated Effluent - Not Water Company	21st December 2012	Groundwater Via A Soakaway	S	367
Sewage Discharges - Final/Treated Effluent - Not Water Company	17th April 2012	Groundwater Via Borehole	E	383
Sewage Discharges - Final/Treated Effluent - Not Water Company	16th March 2012	Groundwater Via Borehole	E	392
Sewage Discharges - Final/Treated Effluent - Not Water Company	27th September 2012	Groundwater	E	413
Sewage Discharges - Final/Treated Effluent - Not Water Company	29th August 2018	Groundwater Via A Soakaway	E	445
Sewage Discharges - Final/Treated Effluent - Not Water Company	21st December 2012	Groundwater Via A Soakaway	NE	464
Sewage Discharges - Final/Treated Effluent - Not Water Company	21st December 2012	Groundwater Via Double Borehole System	E	491

Table 2.2 Details of discharge consents within 500m of site

No groundwater aquifer abstraction was recorded within 1km of the site.

No prosecutions relating to controlled waters were identified within the site.

The site was indicated by the BGS to be in an area identified as having a limited potential for groundwater flooding to occur. Note, the mapping is a susceptibility set, it does not indicate hazard or risk, i.e. it does not provide any information on the depth to which groundwater flooding occurs or the likelihood of the occurrence of an event of a particular magnitude.

2.4 Hydrology

The nearest surface water feature (Unnamed Pond) was identified 527m to the south-west of the site.

No pollution incidents to controlled waters were identified within a radius of 500m of the site.

The site was indicated to be located within an area designated as limited potential for flooding. These are defined as Land having a less than 1 in 1,000 annual probability of river or sea flooding. (Shown as 'clear' on the Flood Map – all land outside Zones 2 and 3).

The site was indicated to be outside any area at risk of extreme flooding.

No licensed surface water abstractions were recorded within 1km of the site.

No discharge consents to surface water were recorded within a 500m of the subject site.

2.5 Radon

Based on data supplied by the British Geological Survey (BGS), the estimated probability of the property being above the Action Level for radon is: 5-10%, Intermediate probability area.

Basic Radon protection measures are required for new dwellings.

2.6 Environmental Data

Searches of other various environmental databases were made as part of the desk study, including air pollution control sites, Part IIA contaminated land, Integrated Pollution Control (IPC) and Integrated Pollution Prevention and Control (IPPC) sites, registered radioactive substances, COMAH sites, explosives sites, Notification of Installations Handling Hazardous Substances (NIHHS) sites, planning permissions for sites involving hazardous substances, fuel station registers, points of interest – commercial services and points of interest – manufacturing and production.

No contaminated land register entries were recorded within a 1km radius of the site.

No Integrated Pollution Controls were recorded within a 1km radius of the site.

No Integrated Pollution Prevention and Control entries were recorded within a 1km radius of the site.

One Local Authority Pollution Controls was recorded within a 1km radius of the site:

**Desk Study Report**

- Petrol filling station, Permitted, 530m S, dated 31/12/98

The desk study identified seven Contemporary Trade Directory entries within 250m of the site:

Name	Classification	Status	Direction	Distance (m)
Steve Wells Joinery	Joinery Manufacturers	Inactive	W	78
Smartbodywork	Car Body Repairs	Active	N	116
Smart Body Work	Car Body Repairs	Inactive	N	126
Redhill Gates & Fences	Gate Manufacturers	Inactive	N	161
F Newman & Sons	Farriers	Inactive	SE	202
Bill Rawles Classic Cars	Car Body Repairs	Active	S	241
Universal Marking Systems	Printing Equipment Manufacturers	Active	S	249

Table 2.3 Contemporary trade directories within a 250m radius of site

The desk study identified two Fuel Station entries within 1km of the site:

- The Chawton End Garage, 14 Winchester Road, Obsolete, 476m SE
- Four Marks SF Connect, 57 Winchester Road, Open, 530m S

2.7 Soil Chemistry

Data obtained as part of the desk study provides details on the estimated soil chemistry for the natural soils in the vicinity of the site. The estimated soil quality on the subject site is presented Table 2.4.

Contaminant	Estimated Concentration (mg/kg)
Arsenic	<15
Cadmium	<1.8
Chromium	60-90
Lead	<100
Nickel	15-30

Table 2.4 Estimated Soil Concentrations on site

The natural background concentrations were below respective published Soil Guideline Values, Generic Assessment Criteria and Category 4 Screening Levels for the protection of human health under a residential (with homegrown produce) land use, i.e. the most conservative end use proposed.

However, these values are not necessarily representative of the site's soil chemistry. Furthermore, some SGVs and GACs are dependent on pH and soil organic matter content. Therefore, concentrations of specific determinants and the utilised SGV/GAC cannot be determined without site specific investigation and analysis.

2.8 Sensitive Land Uses

A search was made of environmentally sensitive areas, including areas of green belt, scenic or natural beauty, parks, reserves, nitrate zones, protected conservation and scientific areas.

The Envirocheck recorded the following sensitive land uses within 1km of the site:

- Nitrate Vulnerable Zone; on site
- Ancient Woodland (8No.); 166m to 934m

2.9 Geotechnical Data

According to the Coal Authority, the site was located in an area that might not be affected by coal mining activities.

National databases for a number of different geological hazards have been compiled by the BGS, and a summary of the hazard data pertaining to the site itself is presented in Table 2.5.

Hazard	Designation
Non-coal mining	Rare
Collapsible ground	Very Low
Compressible ground	No Hazard
Ground dissolution	High
Landslide	Very Low
Running sand	Very Low
Shrinking and Swelling clay	Low

Table 2.5 Summary of BGS Geological Hazards

No man-made mining cavities were identified within 250m of the site.

No natural cavities were identified within 500m of the site.

2.10 Landfill and Waste Management Facilities

A search of BGS recorded landfill sites, IPC registered waste sites, licensed waste management facilities, local authority recorded landfill sites, other registered landfill sites, waste transfer stations and other waste treatment or disposal sites was undertaken as part of the desk study. Such sites may form an artificial source of ground gases, such as carbon dioxide and methane, where wastes are buried or disposed of to landfill.

None of the above site were identified within 1km of the site boundary.

Twenty-one areas of potentially infilled land comprising unknown filled ground were identified within a radius of 500m the site, as shown in Table 2.6.

Use	Date	Direction	Distance (m)
Unknown Filled Ground (Pit, quarry etc)	1981	S	21
Unknown Filled Ground (Pit, quarry etc)	1981	NW	59
Unknown Filled Ground (Pit, quarry etc)	1981	S	354
Unknown Filled Ground (Pit, quarry etc)	1981	SE	385
Unknown Filled Ground (Pond, marsh, river, stream, dock etc.)	1961	SE	469
Unknown Filled Ground (Pit, quarry etc)	1981	SE	469
Unknown Filled Ground (Pit, quarry etc)	1981	NW	485
Unknown Filled Ground (Pit, quarry etc)	1981	S	491

Table 2.6 Details of potentially infilled land within 500m of site

2.11 Historic Mapping

Historic maps dating back to 1870 were obtained as part of the desk study. A summary of the apparent key features observed on the map extracts both on the site and within the local area is presented within Table 2.7.

Date	On Site	Off Site
1870	Site comprises agricultural fields bordered by hedgerows.	Area immediately around site comprised agricultural land. Two sites marked as old chalk pit adjacent to site boundary on south side and north west corner. Property labelled as Redhill Farm located immediately north of site comprising one main building with six smaller outbuildings. Boynes wood located approximately 100m east of site expands into Chawton Park Woods approximately 500m north east of site. Open water marked as Five Ash Pond located approximately 500m to the west. A railway line and main road both trending east-west are located between approximately 250m and 500m from the southernmost boundary of the site. Town of Roc Downs located approximately 300m north of site. Town of Four Marks located approximately 500m south east of site adjacent to rail line.
1872-1874	No significant changes	No significant changes
1896	No significant changes	No significant changes
1897	No significant changes	Four tree plantations labelled approximately 500m east of site.
1910	No significant changes	Buildings constructed around Redhill Farm to the north.
1911	No significant changes	Development of Four Marks beyond railway line to the south approximately 1km from southern site boundary.
1937	No significant changes	Development of agricultural land around entirety of site with residential properties and associated gardens.
1939	No significant changes	No significant changes
1947 (Aerial)	No significant changes	No significant changes
1961-1962	No significant changes	Expansion of town of Four Marks on southern side of rail line. Two of the four plantations to the east developed with residential properties and gardens.
1977	No significant changes	Further development of land immediately bordering site with residential properties, including a housing development site to the immediate north east. Chalk pit to the immediate north west no longer mapped. Pit to immediate south east labelled as disused.

Date	On Site	Off Site
1981	No significant changes	No significant changes
1986-1987	No significant changes	No significant changes
1990	Insufficient coverage	Insufficient coverage
1994	No significant changes	No significant changes
1999 (aerial photography)	No significant changes	Chalk pits immediately bordering sites appear to be overgrown.
2000	No significant changes	No significant changes
2006	No significant changes	No significant changes
2019	No significant changes	Expansion of residential properties on northern side of railway line approximately 200m south of site.

Table 2.7 Summary of Historic Map extracts

Historic mapping has shown the site comprised part of a field network and remains undeveloped. As such no specific potentially contaminative historical use has been identified.

The surrounding land comprised primarily open space and gradually became developed for residential purposes in all directions with chalk pits, thought to be infilled, located to the immediate north west and south of site.

2.12 Asbestos

Given that no buildings are present on site, it is unlikely that asbestos containing materials (ACM) are present on site. However, in line with current best practice, asbestos and ACM should assumed to be present until proven otherwise.

2.13 Previous Ground Investigations

Geo-Environmental was not aware of any previous investigations that had been undertaken on the subject site.

There were no BGS borehole records within the immediate vicinity of the site.

2.14 Potential Contamination

No potentially contaminative activities have been identified on the site. Potentially infilled land (chalk pits) have been identified in close proximity to the site. Industrial land uses (fuel station, joiners, car body repair) have been identified in the wider site surroundings to the west and north, with the limited potential for on-site migration of potential contaminants, including chlorinated solvents and hydrocarbons. Furthermore, elevated concentrations of contaminants of concern could potentially be present within any Made Ground and natural soils underlying the site. Whilst gross contamination is considered unlikely based on the information reviewed, it would be prudent to assume the presence of commonly occurring brownfield contaminants such as metals, inorganics, PAH compounds, TPH compounds, and asbestos. Testing would be recommended to verify the actual concentrations of these substances within the near surface soils.

2.15 Ground Gas Summary

The desk study has not identified any historic landfill sites within 1km of the site. However, two potentially infilled chalk pits have been identified in close proximity to the site. As such, areas subject to backfilling with

putrescible materials have the potential to present a source of ground gases including methane and carbon dioxide, with the potential for ground gas migration onto the subject site.

3.0 PRELIMINARY ASSESSMENT

Based on the findings of the desk study, the following sections summarise the anticipated geotechnical and environmental factors likely to impact the site.

3.1 Geotechnical Risk Assessment

3.1.1 Potential Geotechnical Issues

The following factors that might impact the geotechnical condition of the site were identified as part of the desk study:

Hazards identified as being potentially present on site could have implications for foundation design and construction. A summary of commonly occurring geotechnical hazards is given in the following table:

Geotechnical Hazard	Probability	Engineering Implications
Lateral changes in ground conditions	Unlikely	Variable ground conditions posed by the geology across the site may affect foundation design, construction and zoning.
Shrinkable soils	Likely	The clays of both the Head Deposits and the Clay with Flint Deposits are likely to be shrinkable horizons.
Significant depths of Made Ground	Unlikely	The site has not been developed meaning it is unlikely that significant areas of deep Made Ground are present.
Aggressive chemical ground conditions (sulphates)	Unlikely	The possible presence of aggressive chemical ground conditions within the underlying geology may affect foundation design and construction.
Shallow Groundwater	Likely	The presence of shallow groundwater is considered to be potentially possible.
Potential for shallow soakaways to be unviable	Likely	Chalk underlying site should provide sufficient drainage. However, the use of conventional soakaways would be dependent on the thickness of the superficial deposits overlying the Chalk. Deep bored soakaways may be required.
Potential for dissolution features	Likely	Whilst no visual evidence of dissolution features was recorded by the walkover survey, their presence cannot be completely ruled out. Intrusive investigation would serve to better quantify this risk.
Potential for slope stability issues	Unlikely	No steep slopes are present at the site.

Table 3.1 Possible Geotechnical Hazards

3.2 Preliminary Environmental Conceptual Site Model & Risk Assessment

3.2.1 Methodology

A Preliminary Risk Assessment ('PRA') and Conceptual Site Model ('CSM') have been prepared in accordance with CLR11 based on information obtained as part of the desk study. Possible risks associated with potential sources of contamination and sensitive receptors identified have been qualitatively assessed following a source-pathway-receptor ('Pollutant Linkage') approach in accordance with current UK protocols.

A risk of harm may only exist where a plausible pollutant linkage is present, and where the quantity or concentration of a contaminant is sufficient so as to pose harm. Under the statutory definition, "Contamination" may only strictly exist where contaminants pose a risk of harm to a receptor. The risk classification has been assessed in accordance with CIRIA C552 (Rudland et al., 2001). A summary of how the risks are derived and their definitions are presented in Tables 3.2 and 3.3.

		Consequence			
		Severe	Medium	Mild	Minor
Probability	High Likelihood	Very high risk	High risk	Moderate risk	Moderate/low risk
	Likely	High risk	Moderate risk	Moderate/low risk	Low risk
	Low Likelihood	Moderate risk	Moderate/low risk	Low risk	Very low risk
	Unlikely	Moderate/low risk	Low risk	Very low risk	Very low risk

Table 3.2 Risk Ratings Matrix

Risk Rating	Definitions
Very high risk	<p>There is a high probability that severe harm could arise to a designated receptor from an identified hazard, OR, there is evidence that severe harm to a designated receptor is currently happening.</p> <p>This risk, if realised, is likely to result in a substantial liability.</p> <p>Urgent investigation (if not already undertaken) and remediation are likely to be required.</p>
High risk	<p>Harm is likely to arise to a designated receptor from an identified hazard</p> <p>Realisation of the risk is likely to present a substantial liability.</p> <p>Urgent investigation (if not already undertaken) is required and remediation works may be necessary in the short term and are likely over the longer term.</p>
Moderate risk	<p>It is possible that harm could arise to a designated receptor from an identified hazard. However, it is either relatively unlikely that any such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild.</p>
Moderate to low risk	<p>It is possible that harm could arise to a designated receptor from an identified hazard. However, it is unlikely that any such harm would be severe, or if any harm were to occur it is probable that the harm would be relatively mild.</p>
Low risk	<p>It is possible that harm could arise to a designated receptor from an identified hazard, but it is likely that this harm, if realised, would at worst normally be mild.</p>
Very low risk	<p>There is low possibility that harm could arise to a receptor. In the event of such harm being realised it is not likely to be severe.</p>

Table 3.3 Risk Rating Definitions

3.2.2 Summary of Plausible Sources

Possible sources of contamination identified from the desk study are summarised in Table 3.4.

Source	Description	Contaminants
Made Ground and shallow soils	The general quality of Made Ground and shallow soils could be impacted by the presence of contamination.	Possible elevated concentrations of metals, metalloids, TPH and PAH compounds, and asbestos in Made Ground (if present).
Unknown Infilled Ground	The site could be impacted by on-site migration of ground gases from off-site sources	Methane, carbon dioxide, depleted oxygen.
Fuel Station, Joiners and Car Body Repair	The site could be impacted by on-site migration of potentially mobile contaminants from off-site sources.	Solvents, hydrocarbons.

Table 3.4 Possible Sources of Contamination

3.2.3 Summary of Plausible Pathways

The plausible pathways are summarised in Table 3.5. These pathways are based on the proposed residential end use, including houses and gardens.

Pathway	Description
Direct Contact and Ingestion	Ingestion of soil particles, ingestion and bioaccumulation in vegetables/fruit and inhalation of soil derived dust (including tracked back dust), dermal contact.
Inhalation	Inhalation of soil dust both inside and outside of buildings.
Vertical & Lateral Migration	Contaminant movement both vertically through leaching/gravity and horizontally along preferential pathways, e.g. services trenches, or with groundwater.
Root Uptake	Uptake of soil and waterborne contaminants by plants.
Chemical Attack	Attack of buried plastics and concrete by aggressive ground conditions.

Table 3.5 Possible Contamination Pathways

3.2.4 Summary of Plausible Receptors

Potential receptors associated with the site and its development are summarised in Table 3.6.

Receptor	Description	Comments
End Users	Residents/occupants of the proposed development.	The proposed development is likely to include areas of managed communal soft landscaping and private gardens.
Soft Landscaping	Possible areas of planting including lawns, shrubs, trees, etc.	Planting is anticipated in communal soft landscaping and private gardens.
Built Environment	Buried concrete for foundations and plastics for potable water supply pipes may be laid in contact with contaminated soils.	Aggressive ground conditions and depths of Made Ground may be present beneath the site.
Adjacent Land Users	Sensitive land uses identified within the immediate vicinity.	Adjacent land comprises residential and agricultural uses.
Groundwater	Controlled Waters contained within the aquifer(s) beneath the site.	The site overlies a Principal Aquifer. The site is not situated within an SPZ.

Receptor	Description	Comments
Surface Water	Controlled Waters within lakes, rivers, and ponds, etc., or coastal waters.	No surface water was identified on site. The nearest surface water body identified was a pond located 527m south west.

Table 3.6 Possible Receptors of Contamination

Site workers involved in the preparation and construction of the development have not been considered further in this assessment as the Principal Contractor is duty bound under the current CDM Regulations to undertake their own risk assessments with respect to their employees.

Whilst the above sources and receptors have been identified, Table 3.7 summarises the identified plausible pollution linkages and a qualitative assessment of the risks based on the desk study research.

Potential Source/media	Potential Receptors	Potential Pathways	Likelihood	Severity	Risk and Justification
Contaminants of concern (Made Ground and shallow Soils)	End users	Direct contact	Likely	Minor	Low End users are likely to come into contact with soils via direct contact as the development will include managed communal soft landscaping and private gardens. However, significant contamination is not anticipated.
	Soft Landscaping	Root Uptake	Likely	Minor	Low Gardens and soft landscaping are proposed. However, no evidence of harm to existing plant life was identified and significant contamination is not anticipated.
	Adjacent land users	Direct contact	Unlikely	Minor	Very Low Adjacent site users are unlikely to come into contact with soils. The consequence is likely to be minor.
	Water supply pipes	Direct contact	Unlikely	Minor	Very Low Water supply pipes could come into contact with impacted or aggressive soils depending upon depth of installation and extent of soil impact.
	Buildings and infra-structure	Direct contact	Likely	Minor	Low Foundations and utilities will be placed within potentially aggressive soils. However, the consequence is anticipated to be minor.
	Groundwater	Vertical migration	Low	Minor	Very Low Shallow groundwater or perched water could be present within the Head Deposits and Clays with Flints Deposits. The strata beneath the site are classified as a Principal Aquifer and the site is not located in a SPZ. Significant contamination is not anticipated.

Off-site sources (Fuel Station, Joiners, Car Body Repair)	End users	Groundwater flow	Unlikely	Minor	Very Low Shallow groundwater may be present although end users are unlikely to come into contact with impacted groundwater. The stratum beneath the site is classified as a Principal Aquifer.
	Soft Landscaping	Groundwater flow Root Uptake	Unlikely	Minor	Very Low Gardens and soft landscaping are proposed but are unlikely to come into contact with shallow groundwater. No evidence of harm to existing plant life was identified.
	Water supply pipes	Direct contact	Likely	Minor	Low Water supply pipes could come into contact with impacted or aggressive soils depending upon depth of installation and extent of soil impact.
	Buildings and infra- structure	Direct contact	Likely	Minor	Low Foundations and utilities will be placed within potentially aggressive soils. However, the consequence is anticipated to be minor.
Off-site sources of ground gases (areas of infilled ground)	End users	Inhalation	Low likelihood	Medium	Moderate to low It is potentially possible that future end users will come into contact with ground gases should significant putrescible material be present within the former chalk pits.
	Soft Landscaping	Root Uptake	Unlikely	Minor	Very Low Communal gardens and soft landscaping are proposed. The consequence is likely to be minor.
	Adjacent land users	n/a	n/a	n/a	Assessment of the impact on adjacent sites from ground gases arising from offsite sources does not form part of this assessment.
	Water supply pipes	n/a	n/a	n/a	There is no risk to water supply pipes from potential ground gases

	Buildings and infrastructure	n/a	n/a	n/a	There is no risk to buildings and infrastructure from potential ground gases
	Groundwater	n/a	n/a	n/a	There is no risk to groundwater from potential ground gases

Table 3.7 Plausible Pollutant Linkages & Qualitative Risk Assessment

3.3 Preliminary Risk Assessment Summary

The PRA and CSM developed from the information gathered as part of the desk study process have identified plausible potential pollutant linkages that exist in relation to the proposed redevelopment of the site.

The potential pollutant linkages established within this desk study are not considered to prevent development on the subject site, but could require investigation and assessment to support further characterisation, calibration of the CSM and where/if necessary determine a remedial strategy to reduce, remove or otherwise control any risk within the site to key receptors.

It is considered that the overall risk from potential contamination on the site is 'low' albeit with specific potential pollutant linkages being assigned a moderate to low and that further assessment would be necessary to satisfy planning conditions or to provide clarification of the risk assessment.

In order to progress this assessment in line with the National Planning Policy Framework, to provide further characterisation of the site and refinement of the PRA and CSM, it is recommended that intrusive investigation and associated testing is undertaken to confirm the findings of the desk study report and to provide a robust risk assessment for the site and proposed redevelopment. As such it is recommended that geochemical and geotechnical investigation be carried out on the site to include analysis of soil and groundwater (if encountered) samples for the range of potential contaminants identified within the Desk Study, together with ground gas monitoring and an assessment of the site's ground gas regime.

3.4 Preliminary Geotechnical Assessment Summary

The site is anticipated to be underlain by Head Deposits and the Clay with Flints Deposits overlying Chalk of the Seaford Chalk Formation.

It is possible that conventional strip or pad foundations could be suitable for the proposed development. Whilst chalk deposits would be non-shrinkable, superficial soils containing a higher proportion of cohesive materials may be subject to a higher volume change potential in accordance with NHBC guidance. Where foundations are within cohesive soils, the foundation design would also need to account for the presence of several trees on the site boundary and these could require the localised deepening of foundations.

If the Client has developed any other sites in close proximity to this site, it may be prudent to review the foundation solution for that site as an indicator of the possible solution for this site. However, an intrusive investigation will be required in due course in order to inform the design process.

If tree influence dictates that foundations greater than 2.5m bgl are required, or poor construction conditions are identified from review of nearby development sites, then a piled foundation solution may be required.

It is possible that soakaways within the Chalk may function on this site, although this would be subject to testing to inform design. It may also be necessary (subject to testing) to utilise on-site storage and attenuation of peak storm flow, through systems such as porous paving and cellular storage crates. Should the Chalk be present at significant deep borehole soakaways may be required subject to testing and regulatory approval.

4.0 CONCLUSIONS AND RECOMMENDATIONS

4.1 Conclusions

The desk study has shown the site to have remained as open fields until the present day. The surrounding land comprised primarily open space and gradually became developed for residential purposes to the north and east, with sparse residential properties to the south and west. Some commercial and industrial uses are established on land to the north of the site. Areas of potentially infilled ground have been identified adjacent to the site.

The proposed end use of the site is understood to comprise residential properties with gardens and associated infrastructure. As such, sensitive uses, such as in private gardens with gardening activities (including dust being tracked back into buildings) and growing vegetables, are considered likely to form part of the end use scenario for this site.

It is concluded that the overall risk of harm to end users is generally low (as defined in Section 3) but that further assessment is likely to be required in order to better characterise contamination on site as result of current and historical land uses and the associated risk to human health and the environment.

It is possible that conventional foundations would be suitable for the proposed development, although any design should account for the potential presence of shrinkable soils and trees in proximity to proposed foundations.

4.2 Recommendations

At this stage and based on the findings of the desk study and preliminary risk assessment, the following scope of works is recommended for the intrusive investigation on the site:

- Intrusive investigation works should be carried out in order to clarify the geotechnical and geo-environmental issues pertaining to redevelopment of the site.
- Soil and groundwater (if encountered) sampling and analysis should be undertaken to inform subsequent geotechnical and geo-environmental risk assessment.
- Ground gas monitoring and assessment should be undertaken to characterise the site's ground gas regime.
- Laboratory analysis, on soil samples recovered from the exploratory holes for a range of geotechnical parameters to support foundation design and the like.
- Laboratory analysis, on shallow soil samples and groundwater samples recovered from the exploratory holes, for an analytical suite to include the potential contaminants identified within the desk study and encountered during any intrusive investigation. The suite should include commonly occurring metals, non-metals, asbestos, TPH, and PAH.
- Waste Acceptance Criteria testing may be required if surplus spoil is to be disposed of from the development.

It may be necessary to undertake remediation/risk mitigation measures on this site to break pollutant linkages and thus protect key receptors such as human health, controlled waters, built environment, soft landscaping and the like. The requirement and extent of any such remediation cannot be determined until such time as an intrusive investigation and associated testing has been completed.

A decorative graphic consisting of three horizontal, wavy blue bands that overlap each other, creating a sense of depth and movement. The bands are a solid medium blue color.

 Geo-Environmental					

Possible Pollutant Linkages:

1. Direct contact with contaminated soils, ingestion of contaminated soils
2. Inhalation of soil dusts indoor and outdoor, and inhalation of gases/vapours within buildings
3. Vertical and lateral migration through permeable strata and with groundwater
4. Shallow groundwater vertical and lateral migration
5. Chemical attack of buried plastics and concrete
6. Gas migration to site from off-site former chalk pits including inhalation of gases and accumulation within buildings
7. Lateral migration from off-site commercial land uses

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.
